Abstract

In this paper we introduced new type of closed sets is called $\delta\omega\alpha$ -closed sets in the topological spaces. Moreover we discuss the relations between $\delta\omega\alpha$ -closed sets and already available various closed sets. Also we studied some properties and applications of $\delta\omega\alpha$ -closed, $\delta\omega\alpha$ -interior and $\delta\omega\alpha$ -closure.

Key Words: $\delta\omega\alpha$ -closed sets, $\delta\omega\alpha$ -open sets, $\delta\omega\alpha$ -interior and $\delta\omega\alpha$ -closure.

AMS subject classification: 54C55, 54A05

1. INTRODUCTION

In 1968 Velicko introduced δ -closed set in Topological spaces [19]. Using δ -closed set several results introduced by many researcher. $\omega\alpha$ -closed set [1] introduced by S. S. Benchalli, et al., in the year 2009. Since the advent of these types of notions, several author have been introduced interesting results. δg -closed set introduced by Dontchev [3] (1999). In 1965 Njastad [10] introduced α -open sets. The aim of the present paper is study the concept of $\delta\omega\alpha$ -closed sets and its various characterizations are investigated. Also, we further studied about $\delta\omega\alpha$ -interior $\delta\omega\alpha$ -closure in topological spaces.

2. PRELIMINARIES

Throughout this research paper (X, τ) (or simply X) represent topological spaces, For a subset A of X , $\text{cl}(A)$, $\text{int}(A)$ and A^c denote the closure of A , the interior of A and the complement of A respectively.

Let us recall the following definition, which are useful in the sequel.

Definition: 2.1

A subset A of (X, τ) is called if

- 1) Regular closed set [18] if $\text{cl}(\text{int}(A)) = A$.
- 2) Semi closed set [6] if $\text{int}(\text{cl}(A)) \subseteq A$
- 3) α - closed set [10] if $\text{cl}(\text{int}(\text{cl}(A))) \subseteq A$
- 4) δ -closed [19] if $A = \text{cl}_\delta(A)$, where $\text{cl}_\delta(A) = \{x \in X: \text{int}(\text{cl}(G)) \cap A \neq \emptyset, G \in \tau \text{ and } x \in G\}$.
- 5) g -closed set [5] if $\text{cl}(A) \subseteq U$ whenever $A \subseteq U$, U is open in (X, τ) .
- 6) αg -closed set [7] if $\alpha \text{cl}(A) \subseteq U$ whenever $A \subseteq U$, U is open in (X, τ) .
- 7) $g\alpha$ -closed set [8] if $\alpha \text{cl}(A) \subseteq U$ whenever $A \subseteq U$, U is α open in (X, τ) .
- 8) δg -closed set [3] if $\delta \text{cl}(A) \subseteq U$ whenever $A \subseteq U$, U is open in (X, τ) .
- 9) $g\delta$ -closed set [4] if $\text{cl}(A) \subseteq U$ whenever $A \subseteq U$, U is δ -open in (X, τ) .
- 10) $\delta g^\#$ -closed set [20] if $\delta \text{cl}(A) \subseteq U$ whenever $A \subseteq U$, U is δ -open in (X, τ) .
- 11) ω -closed set [16] if $\text{cl}(A) \subseteq U$ whenever $A \subseteq U$, U is semi open in (X, τ) .
- 12) $\omega\alpha$ -closed set [1] if $\alpha \text{cl}(A) \subseteq U$ whenever $A \subseteq U$, U is ω -open in (X, τ) .
- 13) $\alpha\omega$ -closed set [12] if $\omega\text{-cl}(A) \subseteq U$ whenever $A \subseteq U$, U is α -open in (X, τ) .
- 14) δg^* -closed set [17] if $\delta \text{cl}(A) \subseteq U$ whenever $A \subseteq U$, U is g -open in (X, τ) .
- 15) $g\omega\alpha$ -closed set [2] if $\alpha \text{cl}(A) \subseteq U$ whenever $A \subseteq U$, U is $\omega\alpha$ -open in (X, τ) .
- 16) $g^*\omega\alpha$ -closed set [11] if $\text{cl}(A) \subseteq U$ whenever $A \subseteq U$, U is $\omega\alpha$ -open in (X, τ) .
- 17) $\delta(\delta g)^*$ -closed set [9] if $\delta \text{cl}(A) \subseteq U$ whenever $A \subseteq U$, U is δg -open in (X, τ) .

The complements of the above listed closed sets are their concern open sets.

3. $\delta\omega\alpha$ -CLOSED SETS

In this section we introduce $\delta\omega\alpha$ -closed set in topological space (X, τ) .

Definition: 3.1

A subset A of a topological space (X, τ) is called $\delta\omega\alpha$ -closed set if $\text{cl}_\delta(A) \subseteq U$ whenever $A \subseteq U$, U is $\omega\alpha$ -open set in (X, τ) . the complement of $\delta\omega\alpha$ -closed set is called $\delta\omega\alpha$ -open set.

Proposition 3.2

Every δ -closed set is $\delta\omega\alpha$ -closed.

Proof:

Assume that A is a δ -closed and Let U be any $\omega\alpha$ -open set such that $A \subseteq U$. Here A is δ -closed. $A = \text{cl}_\delta(A)$ for any subset A in (X, τ) . This implies that $\text{cl}_\delta(A) \subseteq U$. Here A is $\delta\omega\alpha$ -closed Set.

Remark: 3.3

Converse of the above theorem need not be true from the following example.

Let (X, τ) be a topological space with $X = \{a, b, c\}$ and $\tau = \{\emptyset, X, \{a\}, \{a, c\}, \{c\}, \{b, c\}\}$. Here we take a subset $A = \{c\}$, A is $\delta\omega\alpha$ closed but not δ -closed.

Proposition 3.4

Every regular closed set is $\delta\omega\alpha$ -closed.

Proof:

Assume that A is a regular closed set and Let U be any $\omega\alpha$ -open set such that $A \subseteq U$. Here A is regular closed set. This implies A is a δ -closed and $A = \text{cl}_\delta(A)$ for any subset A in (X, τ) . This implies that $\text{cl}_\delta(A) \subseteq U$. Here A is $\delta\omega\alpha$ -closed Set.

Remark: 3.5

Converse of the above theorem need not be true from the following example.

Let (X, τ) be a topological space with $X = \{a, b, c, d, e\}$ and

$\tau = \{\emptyset, X, \{a\}, \{b\}, \{d\}, \{a, b\}, \{a, d\}, \{b, d\}, \{a, b, d\}\}$ Here we take a subset $A = \{a, b, c, e\}$. A is $\delta\omega\alpha$ closed but not r -closed.

Proposition 3.6

Every $\delta\omega\alpha$ -closed set is δg -closed.

Proof:

Consider, A is a $\delta\omega\alpha$ closed set and Let U be an open such that $A \subseteq U$. We know that, every open set is $\omega\alpha$ -open set. Therefore U is an $\omega\alpha$ open set such that $A \subseteq U$. Here A is $\delta\omega\alpha$ -closed set, it imply that $\text{cl}_\delta(A) \subseteq U$. Hence A is δg -closed in (X, τ) .

Remark: 3.7

Converse of the above the theorem need not be from the following example.

Let (X, τ) be a topological space with $X = \{a, b, c\}$ and $\tau = \{\emptyset, X, \{a\}, \{a, c\}, \{c\}, \{b, c\}\}$.

Here we take a subset $A = \{a, c\}$. A is δg closed not $\delta\omega\alpha$ -closed set in (X, τ) .

Proposition: 3.8

Every $\delta\omega\alpha$ -closed set is αg -closed.

Proof:

Let A be any $\delta\omega\alpha$ -closed set in (X, τ) and V be an open set such that $A \subseteq V$.

Therefore V is an $\omega\alpha$ -open set such that $A \subseteq V$. Since A is $\delta\omega\alpha$ -closed set, it implies that $\text{cl}_\delta(A) \subseteq V$. But $\alpha\text{cl}(A) \subseteq \text{cl}_\delta(A)$ for any A . Therefore $\alpha\text{cl}(A) \subseteq V$. V is an open set in (X, τ) . Hence A is αg -closed.

Remark: 3.9

Converse of the above theorem need not be true from the following example,

Let (X, τ) be a topological space with $X = \{a, b, c, d\}$ and $\tau =$

$\{\emptyset, X, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}\}$. Here we take a subset $A = \{d\}$. A is αg -closed but not $\delta\omega\alpha$ -set in (X, τ) .

Proposition 3.10

Every $\delta\omega\alpha$ -closed set is $\alpha\omega$ -closed.

Proof:

Let A be a $\delta\omega\alpha$ -closed and U be α -open set in (X, τ) such that $A \subseteq U$. Since every α -open set is $\omega\alpha$ -open set and A is $\delta\omega\alpha$ -closed, then $\omega\text{cl}(A) \subseteq \text{cl}(A) \subseteq \text{cl}_\delta(A) \subseteq U$.

Where U is $\omega\alpha$ -open set. It implies that $\omega\text{cl}(A) \subseteq U$. Hence A is $\alpha\omega$ -closed in (X, τ) .

Remark: 3.11

Converse of the above the theorem need not be from the following example.

Let (X, τ) be a topological space with $X = \{a, b, c, d\}$ and $\tau =$

$\{\emptyset, X, \{a\}, \{b\}, \{a, b\}, \{a, c\}, \{a, b, c\}\}$.

Here we take a subset $A = \{a, b, c\}$. A is $\alpha\omega$ closed not $\delta\omega\alpha$ -closed set in (X, τ) .

Proposition 3.12

Every $\delta\omega\alpha$ -closed set is $g\omega\alpha$ -closed but converse need not be true.

Proof:

Let A be a $\delta\omega\alpha$ -closed and U be an $\omega\alpha$ -open set in (X, τ) such that $A \subseteq U$. Since A is $\delta\omega\alpha$ -closed, then $\text{cl}_\delta(A) \subseteq U$. But $\text{cl}(A) \subseteq \text{cl}_\delta(A) \subseteq U$ [4], it implies that $\text{cl}(A) \subseteq U$. Hence A is $g\omega\alpha$ -closed set.

Remark 3.13

Converse of the above theorem need not be true from the following example,

Let (X, τ) be a topological space with $X = \{a, b, c\}$ and $\tau = \{\phi, X, \{a\}, \{a, b\}\}$. Here we take a subset $A = \{c\}$. A is $g\omega\alpha$ -closed but not $\delta\omega\alpha$ -closed.

Proposition 3.14

Every $\delta\omega\alpha$ -closed set is $g^*\omega\alpha$ -closed but converse need not be true.

Proof:

Let A be a $\delta\omega\alpha$ -closed and U be an $\omega\alpha$ -open set in (X, τ) such that $A \subseteq U$. Since A is $\delta\omega\alpha$ -closed, then $\text{cl}_\delta(A) \subseteq U$. But $\text{acl}(A) \subseteq \text{cl}_\delta(A) \subseteq U$, it implies that $\text{acl}(A) \subseteq U$. Hence A is $g^*\omega\alpha$ -closed set.

Remark 3.15

Converse of the above theorem need not be true from the following example, Let (X, τ) be a topological space with $X = \{a, b, c\}$ and $\tau = \{\phi, X, \{a\}, \{a, b\}\}$. Here we take a subset $A = \{c\}$. A is $g^*\omega\alpha$ -closed but not $\delta\omega\alpha$ closed.

Theorem 3.16

Every $\delta\omega\alpha$ -closed set is $g\alpha$ -closed set but converse need not be true.

Proof:

Let A be a $\delta\omega\alpha$ -closed and U be an α -open set in (X, τ) such that $A \subseteq U$. Since A is $\delta\omega\alpha$ -closed, then $\text{cl}_\delta(A) \subseteq U$. because every α -open set is $\omega\alpha$ -open set in (X, τ) . But $\text{acl}(A) \subseteq \text{cl}_\delta(A) \subseteq U$, it implies that $\text{acl}(A) \subseteq U$. Hence A is $g\alpha$ -closed set.

Remark 3.17

Converse of the above theorem need not be true from the following example,

Let (X, τ) be a topological space with $X = \{a, b, c\}$ and $\tau = \{\phi, X, \{a\}\}$.

Here we take a subset $A = \{c\}$. A is $g\alpha$ -closed but not $\delta\omega\alpha$ closed.

Theorem 3.18

Every $\delta\omega\alpha$ -closed set is $\delta g^\#$ -closed but converse need not be true.

Proof:

Let A be a $\delta\omega\alpha$ -closed and U be an δ -open set in (X, τ) such that $A \subseteq U$. Since A is $\delta\omega\alpha$ -closed, then $\text{cl}_\delta(A) \subseteq U$ where U is $\omega\alpha$ -open set. It implies that $\text{cl}_\delta(A) \subseteq U$. Hence A is $\delta g^\#$ -closed set.

Remark 3.19

Converse of the above theorem need not be true from the following example,

Let (X, τ) be a topological space with $X = \{a, b, c\}$ and $\tau = \{\emptyset, X, \{a\}\}$. Here we take a subset $A = \{c\}$. A is $\delta g^\#$ -closed but not $\delta\omega\alpha$ closed.

Theorem 3.20

Every $\delta\omega\alpha$ -closed set is $g\delta$ -closed but converse is not need be true.

Proof:

Let A be a $\delta\omega\alpha$ -closed and U be an δ -open set in (X, τ) such that $A \subseteq U$. Since A is $\delta\omega\alpha$ -closed, then $\text{cl}_\delta(A) \subseteq U$. But $\text{cl}(A) \subseteq \text{cl}_\delta(A) \subseteq U$, it implies that $\text{cl}(A) \subseteq U$. Hence A is $g\delta$ -closed set.

Remark 3.21

Converse of the above theorem need not be true from the following example,

Let (X, τ) be a topological space with $X = \{a, b, c\}$ and $\tau = \{\emptyset, X, \{a\}\}$.

Here we take a subset $A = \{c\}$. A is $g\delta$ -closed but not $\delta\omega\alpha$ closed.

Remark 3.22

$\delta\omega\alpha$ -closed set is independent with following closed sets are

closed set, α -closed set, $\omega\alpha$ -closed set, δg^* -closed set, and $\delta(\delta g)^*$ closed set

above result we can prove by using following examples.

Example 3.23

Let (X, τ) be a topological space with $X = \{a, b, c\}$ with $\tau = \{\emptyset, \{a\}, \{a, b\}, X\}$.

Here we take a subset $A = \{c\}$. A is closed, α -closed and $\omega\alpha$ -closed set but not $\delta\omega\alpha$ -closed set.

Example 3.24

Let (X, τ) be a topological space with $X = \{a, b, c\}$ with $\tau = \{\emptyset, \{a\}, \{b, c\}, X\}$.

The subset $A = \{b\}$ is $\delta\omega\alpha$ -closed set but not closed, α -closed and $\omega\alpha$ -closed in (X, τ) .

Example 3.25

Let (X, τ) be a topological space with $X=\{a,b,c,d\}$ with $\tau=\{ \phi, \{c\}, \{a,b\}, \{c,d\}, \{a,b,c\}, X\}$.

Here we take a subset $A=\{b,c,d\}$. A is not δg^* and $\delta(\delta g)^*$ closed set but $\delta\omega\alpha$ -closed set.

Example 3.26

Let (X, τ) be a topological space with $X=\{a,b,c\}$ with $\tau = \{ \phi, \{a\}, \{a,b\}, X\}$.

Here we take a subset $A = \{c\}$. A is δg^* and $\delta(\delta g)^*$ closed set but not $\delta\omega\alpha$ -closed set.

Diagram-I

Where $A \longrightarrow B$ represents A implies B but B does not implies A

Where $A \longleftrightarrow B$ represents A independent B each other.

4. PROPERTIES AND CHARACTERIZATION OF $\delta\omega\alpha$ -CLOSED

Theorem 4.1

The finite union of $\delta\omega\alpha$ -closed sets is $\delta\omega\alpha$ -closed.

Proof:

Let $\{A_i / i = 1, 2, \dots, n\}$ be finite class of $\delta\omega\alpha$ -closed subsets of a space (X, τ) . Then for each $\omega\alpha$ -open Set U_i in (X, τ) containing A_i , $cl_\delta(A_i) \subseteq U_i$ $i \in \{1, 2, \dots, n\}$. Hence $U_{i=1}^n A_i \subseteq U_{i=1}^n U_i = V$. Since arbitrary union of $\omega\alpha$ -open sets in (X, τ) is also $\omega\alpha$ -open Set in (X, τ) , V is $\omega\alpha$ -open in (X, τ) . Also, $U_i cl_\delta(A_i) = cl_\delta(U_i A_i) \subseteq V$. Therefore $U_i A_i$ is $\delta\omega\alpha$ -closed in (X, τ) .

Remark 4.2:

Intersection of any two $\delta\omega\alpha$ -closed sets in (X, τ) need not be $\delta\omega\alpha$ -closed.

Let (X, τ) be a topological space with $X = \{a, b, c\}$ with $\tau = \{\emptyset, X, \{a\}, \{c\}, \{a, c\}, \{b, c\}\}$.

Here we take two subsets $\{a, b\}$ and $\{b, c\}$ are $\delta\omega\alpha$ -closed sets but their intersection of two sets $\{b\}$ is not $\delta\omega\alpha$ -closed.

Theorem 4.3

Let A be $\delta\omega\alpha$ -closed Set of (X, τ) . Then $\text{cl}_\delta(A) - A$ does not contain a non empty $\omega\alpha$ -Closed set.

Proof:

Suppose that A is $\delta\omega\alpha$ -closed. Let G be $\omega\alpha$ -closed set contained in $\text{cl}_\delta(A) - A$. Now G^c is $\omega\alpha$ -open set of (X, τ) Such that $A \subseteq G^c$. Here A is $\delta\omega\alpha$ -closed Set of (X, τ) . Thus $\text{cl}_\delta(A) \subseteq G^c$.

Therefore $G \subseteq (\text{cl}_\delta(A))^c$. Also $G \subseteq \text{cl}_\delta(A) - A$. There $G \subseteq (\text{cl}_\delta(A))^c \cap \text{cl}_\delta(A) = \emptyset$. Hence $G = \emptyset$. Hence $\text{cl}_\delta(A) - A$ does not contain a non empty $\omega\alpha$ -Closed set.

Theorem 4.4

If A is $\omega\alpha$ -open and $\delta\omega\alpha$ -closed subset of (X, τ) then A is δ -closed subset of (X, τ) .

Proof:

We know that $A \subseteq \text{cl}_\delta(A)$. Here A is $\omega\alpha$ -open and $\delta\omega\alpha$ -closed, its implies that $\text{cl}_\delta(A) \subseteq A$. Hence A is δ -closed.

Theorem 4.5

The intersection of a $\delta\omega\alpha$ -closed set and a δ -closed set is $\delta\omega\alpha$ -closed.

Proof:

Let A be $\delta\omega\alpha$ -closed and Let G be δ -closed. Take U is an $\omega\alpha$ -open set with $A \cap G \subseteq U$. This imply $A \subseteq U \cup G^c$. Here $U \cup G^c$ is $\omega\alpha$ -open set. Therefore $\text{cl}_\delta(A) \subseteq U \cup G^c$. Now $\text{cl}_\delta(A \cap G) \subseteq \text{cl}_\delta(A) \cap \text{cl}_\delta(G) = \text{cl}_\delta(A) \cap G \subseteq (U \cup G^c) \cap G = U$. Here $A \cap G$ is $\delta\omega\alpha$ -closed.

Theorem: 4.6

If A is a $\delta\omega\alpha$ -closed set in space (X, τ) and $A \subseteq B \subseteq \text{cl}_\delta(A)$ then B is also $\delta\omega\alpha$ -closed set.

Proof:

Let U be a $\omega\alpha$ -open set of (X, τ) such that $B \subseteq U$. Then $A \subseteq U$. Since A is $\delta\omega\alpha$ -closed set, $\text{cl}_\delta(A) \subseteq U$. Since $B \subseteq \text{cl}_\delta(A)$, $\text{cl}_\delta(B) \subseteq \text{cl}_\delta(\text{cl}_\delta(A)) = \text{cl}_\delta(A)$. Hence $\text{cl}_\delta(B) \subseteq U$. Therefore B is also a $\delta\omega\alpha$ -closed set.

Theorem 4.7.

Let A be $\delta\omega\alpha$ -closed of (X, τ) . Then A is δ -closed set if $\text{cl}_\delta(A) - A$ is $\omega\alpha$ -closed.

Proof:

Let A be a δ -closed Subset of X . Then $\text{cl}_\delta(A) = A$ and so $\text{cl}_\delta(A) - A = \phi$ which is $\omega\alpha$ -closed.

Conversely, Here A is $\delta\omega\alpha$ -closed by theorem 4.3 $\text{cl}_\delta(A) - A$ does not contain a non-empty $\omega\alpha$ -closed set. This imply $\text{cl}_\delta(A) - A = \phi$. Therefore $\text{cl}_\delta(A) = A$. Hence A is δ -closed.

5. $\delta\omega\alpha$ - CLOSURE AND $\delta\omega\alpha$ - INTERIOR IN TOPOLOGICAL SPACES

In this section, we introduce the notion of $\delta\omega\alpha$ - Closure and $\delta\omega\alpha$ -Interior of topological Spaces.

Definition 5.1.

The $\delta\omega\alpha$ - closure of a Subset A of X is denoted by $\delta\omega\alpha\text{-cl}(A)$ and is defined as the intersection of all $\delta\omega\alpha$ -closed sets containing A . Therefore

$$\delta\omega\alpha\text{-cl}(A) = \bigcap \{F \subseteq X: A \subseteq F \text{ and } F \text{ is } \delta\omega\alpha\text{-closed set} \}.$$

Definition 5.2

The $\delta\omega\alpha$ -interior of subset A of X is denoted by $\delta\omega\alpha\text{-(int } A)$ and is defined as the union of all $\delta\omega\alpha$ -open sets contained in A . Therefore

$$\delta\omega\alpha\text{-int}(A) = \bigcup \{G \subseteq X: G \subseteq A \text{ and } G \text{ is } \delta\omega\alpha\text{-open set} \}.$$

Remark 5.3

If $A \subseteq X$ then,

$$(i) \quad A \subseteq \delta\omega\alpha\text{-cl}(A) \subseteq \text{cl}_\delta(A).$$

$$(ii) \quad \text{int}_\delta(A) \subseteq \text{int}(A) \subseteq A.$$

Theorem: 5.4

Let A and B be any two subsets of a space X then the following properties are true.

- (i) A is $\delta\omega\alpha$ -closed set if and only of $\delta\omega\alpha\text{-cl}(A) = A$.
- (ii) $\delta\omega\alpha\text{-cl}(A)$ is the smallest $\delta\omega\alpha$ - closed subset of X containing A .
- (iii) $\delta\omega\alpha\text{-cl}(\phi) = \phi$ and $\phi\delta\omega\alpha\text{-cl}(X) = X$.
- (iv) $\delta\omega\alpha\text{-cl}(A)$ is a $\delta\omega\alpha$ - closed set in (X, τ) ..

- (v) If $A \subseteq B$, then $\delta\omega\alpha\text{-cl}(A) \subseteq \delta\omega\alpha\text{-cl}(B)$
- (vi) $\delta\omega\alpha\text{-cl}(A \cup B) = \delta\omega\alpha\text{-cl}(A) \cup \delta\omega\alpha\text{-cl}(B)$
- (vii) $\delta\omega\alpha\text{-cl}(A \cap B) \subseteq \delta\omega\alpha\text{-cl}(A) \cap \delta\omega\alpha\text{-cl}(B)$
- (viii) $\delta\omega\alpha\text{-cl}(\delta\omega\alpha\text{-cl}(A)) = \delta\omega\alpha\text{-cl}(A)$

Proof:

- (i) we know that $A \subseteq \delta\omega\alpha\text{-cl}(A)$ for any subset A of X . Let A be a $\delta\omega\alpha$ - closed set in (X, τ) . Also $A \subseteq A$ and $A \in \{F \subseteq X: A \subseteq F \text{ and } F \text{ is } \delta\omega\alpha\text{- closed Set}\}$, it implies that $A = \bigcap \{F \subseteq X: A \subseteq F \text{ and } F \text{ is } \delta\omega\alpha\text{- closed Set}\} \subseteq A$. Then $\delta\omega\alpha\text{-cl}(A) \subseteq A$. . Hence $A = \delta\omega\alpha\text{-cl}(A)$.converse is true from the direct definition.
- (ii) By the definition of $\delta\omega\alpha\text{-cl}(A)$,the intersection of any collection sets is closed. There $\delta\omega\alpha\text{-cl}(A)$ is closed.Also if B is any $\delta\omega\alpha$ -closed set containing then $\delta\omega\alpha\text{-cl}(A) \subseteq B$.Therefore $\delta\omega\alpha\text{-cl}(A)$ is the smallest $\delta\omega\alpha$ -closed set in (X, τ) containing A .
- (iii) and (iv) –it follows from the Definition .
- (v) We know that $B \subseteq \delta\omega\alpha\text{-cl}(B)$ for every B . if $A \subseteq B$ then $A \subseteq \delta\omega\alpha\text{-cl}(B)$.So $\delta\omega\alpha\text{-cl}(B)$ is the $\delta\omega\alpha$ -closed set containing A . But $\delta\omega\alpha\text{-cl}(A)$ is smallest $\delta\omega\alpha$ -closed set containing A . Therefore $\delta\omega\alpha\text{-cl}(A) \subseteq \delta\omega\alpha\text{-cl}(B)$.
- (vi) We know that $A \subseteq A \cup B$ and $B \subseteq A \cup B$, applying (v) ,we get $\delta\omega\alpha\text{-cl}(A) \subseteq \delta\omega\alpha\text{-cl}(A \cup B)$ and $\delta\omega\alpha\text{-cl}(B) \subseteq \delta\omega\alpha\text{-cl}(A \cup B)$. Then $\delta\omega\alpha\text{-cl}(A) \cup \delta\omega\alpha\text{-cl}(B) \subseteq \delta\omega\alpha\text{-cl}(A \cup B)$. on the other hand, $\delta\omega\alpha\text{-cl}(A)$ is $\delta\omega\alpha$ - closed set containing A and $\delta\omega\alpha\text{-cl}(B)$ is $\delta\omega\alpha$ -closed set containing B . Therefore $\delta\omega\alpha\text{-cl}(A) \cup \delta\omega\alpha\text{-cl}(B)$ is $\delta\omega\alpha$ -closed set containing $A \cup B$. But $\delta\omega\alpha\text{-cl}(A \cup B)$ is $\delta\omega\alpha$ -closed set containing $A \cup B$. Therefore $\delta\omega\alpha\text{-cl}(A) \cup \delta\omega\alpha\text{-cl}(B) \supseteq \delta\omega\alpha\text{-cl}(A \cup B)$. Therefore $\delta\omega\alpha\text{-cl}(A \cup B) = \delta\omega\alpha\text{-cl}(A) \cup \delta\omega\alpha\text{-cl}(B)$.
- (vii) We know that $A \cap B \subseteq A$ and $A \cap B \subseteq B$. by using (v) we have, $\delta\omega\alpha\text{-cl}(A \cap B) \subseteq \delta\omega\alpha\text{-cl}(A)$ and $\delta\omega\alpha\text{-cl}(A \cap B) \subseteq \delta\omega\alpha\text{-cl}(B)$.
- (viii) we know that $\delta\omega\alpha\text{-cl}(A)$ is a $\delta\omega\alpha$ - closed set in (X, τ) .Let $\delta\omega\alpha\text{-cl}(A) = G$, then G is $\delta\omega\alpha$ - closed Set in (X, τ) . From (i) we have, $\delta\omega\alpha\text{-cl}(G) = G$. It implies that $\delta\omega\alpha\text{-cl}(\delta\omega\alpha\text{-cl}(A)) = \delta\omega\alpha\text{-cl}(A)$. In the example 3.5, subsets $A = \{a\}$ and $B = \{c\}$, then $\delta\omega\alpha\text{-cl}(A) = \{a, c\}$, $\delta\omega\alpha\text{-cl}(B) = \{b, c\}$ and $\delta\omega\alpha\text{-cl}(A \cap B) = \phi$.

Therefore $\{c\} = \delta\omega\alpha\text{-cl}(A) \cap \delta\omega\alpha\text{-cl}(B) \subseteq \delta\omega\alpha\text{-cl}(A \cap B) = \phi$.

Definition 5.5

Let A be any subset of a space X . Then, $\omega\alpha$ -kernel of A is denoted by $\omega\alpha\text{-kernel}(A)$ and is defined as intersection of all $\omega\alpha$ open sets containing A .

Then $\omega\alpha\text{-kernel}(A) = \bigcap \{U \subseteq X: A \subseteq U \text{ and } U \text{ is } \omega\alpha \text{ open set}\}$.

Theorem 5.6

A subset of a space X is $\delta\omega\alpha$ -closed set if and only if $\text{cl}_\delta(A) \subseteq \omega\alpha\text{ker}(A)$.

Proof:

Let U be a $\omega\alpha$ -open set containing A then $\text{cl}_\delta(A) \subseteq \omega\alpha\text{ker}(A) \subseteq U$. Therefore A is $\delta\omega\alpha$ -closed set.

Conversely suppose A is $\delta\omega\alpha$ -closed in (X, τ) . Then $\text{cl}_\delta(A) \subseteq U$ where U is $\omega\alpha$ -open in (X, τ) .

Let $x \in \text{cl}_\delta(A)$. If x does not belong to $\omega\alpha\text{-kernel}(A)$ then there exists an $\omega\alpha\text{-kernel}(A)$ set U containing A such that x does not belong to U . Then x does not belong to $\text{cl}_\delta(A)$, which is a contradiction to the hypotheses. Hence $\text{cl}_\delta(A) \subseteq \omega\alpha\text{ker}(A)$.

Definition 5.7

Let N be any subset of topological space X then N is said to be $\delta\omega\alpha$ -neighborhood (denoted by $\delta\omega\alpha\text{-nbd}$) of point $x \in X$ if there exist an $\delta\omega\alpha$ -open set U such that $x \in U \subseteq N$.

Theorem 5.8

A subset A of topological space X is $\delta\omega\alpha$ -closed and $x \in \delta\omega\alpha\text{-cl}(A)$ if and only if $N \cap A \neq \emptyset$ for Any $\delta\omega\alpha\text{-nbd}$ N of x in (X, τ) .

Proof:

Suppose $x \notin \delta\omega\alpha\text{-cl}(A)$. Then there exists $\delta\omega\alpha$ -closed set F of X such that $A \subseteq F$ and $x \notin F$. Thus $x \in (X-F)$ is $\delta\omega\alpha$ -open in X . But $A \cap (X-F) = \emptyset$ which is a contradiction. Hence $x \in \delta\omega\alpha\text{-cl}(A)$. Conversely, suppose that there exists an $\delta\omega\alpha\text{-nbd}$ N of a point $x \in X$ such that $N \cap A = \emptyset$. Then there exists an $\delta\omega\alpha$ -open set F of X such that $x \in F \subseteq N$. Therefore we have $F \cap A = \emptyset$ and $x \in (X-F)$. Then $\delta\omega\alpha\text{-cl}(A) \subseteq (X-F)$ and $x \notin \delta\omega\alpha\text{-cl}(A)$, which is a contradiction to hypothesis that $x \in \delta\omega\alpha\text{-cl}(A)$. Therefore $N \cap A \neq \emptyset$.

Remark 5.9:

The intersection of any two member of $\delta\omega\alpha\text{-}N(x)$ is again a member of $\delta\omega\alpha\text{-}N(x)$.

Definition 5.10

Let A be a subset of topological space X . Then a point $x \in X$ is said to be a $\delta\omega\alpha$ -limit point of A if every $\delta\omega\alpha$ -open set of x contains a point of A other than x that is $G \cap (A - \{x\}) \neq \emptyset$ for every $\delta\omega\alpha$ -open set G of X . In a topological space X , the set of all $\delta\omega\alpha$ -limit point of given a subset A of X is called $\delta\omega\alpha$ -derived set of A and is denoted by $\delta\omega\alpha\text{-}d(A)$.

Theorem 5.11

Let A and B be any two subsets of a space X then the following properties are true:

- (i) $\delta\omega\alpha\text{-}d(\emptyset) = \emptyset$
- (ii) If $A \subseteq B$, then $\delta\omega\alpha\text{-}d(A) \subseteq \delta\omega\alpha\text{-}d(B)$
- (iii) $\delta\omega\alpha\text{-}d(A \cup B) = \delta\omega\alpha\text{-}d(A) \cup \delta\omega\alpha\text{-}d(B)$
- (iv) $\delta\omega\alpha\text{-}d(A \cap B) \subseteq \delta\omega\alpha\text{-}d(A) \cap \delta\omega\alpha\text{-}d(B)$.

Proof:

(i) Let $x \in X$ and $x \in \delta\omega\alpha\text{-}d(\emptyset)$. Then for every $\delta\omega\alpha$ -open set G containing x , we should have $G \cap (\emptyset - \{x\}) \neq \emptyset$, which is impossible. Therefore $\delta\omega\alpha\text{-}d(\emptyset) = \emptyset$.

(ii) Let $x \in \delta\omega\alpha\text{-}d(A)$ then x is a limit point of A , $G \cap (A - \{x\}) \neq \emptyset$ for every $\delta\omega\alpha$ -nbd G containing x . if $A \subseteq B$, then $G \cap (B - \{x\}) \neq \emptyset$. Therefore $x \in \delta\omega\alpha\text{-}d(B)$. Hence $\delta\omega\alpha\text{-}d(A) \subseteq \delta\omega\alpha\text{-}d(B)$

(iii) We know that $A \subseteq A \cup B$ and $B \subseteq A \cup B$ then from property (ii), $\delta\omega\alpha\text{-}d(A) \cup \delta\omega\alpha\text{-}d(B) \subseteq \delta\omega\alpha\text{-}d(A \cup B)$.. On the other hand if $x \notin \delta\omega\alpha\text{-}d(A) \cup \delta\omega\alpha\text{-}d(B)$, then $x \notin \delta\omega\alpha\text{-}d(A)$ and $x \notin \delta\omega\alpha\text{-}d(B)$. Therefore there exist $\delta\omega\alpha$ -nbds G_1 and G_2 of x such that $G_1 \cap (A - \{x\}) = \emptyset$ and $G_2 \cap (B - \{x\}) = \emptyset$. Since $G_1 \cap G_2$ is $\delta\omega\alpha$ -nbd of x , then we get $(G_1 \cap G_2) \cap [(A \cup B) - \{x\}] = \emptyset$. Therefore $x \notin \delta\omega\alpha\text{-}d(A \cup B)$. Therefore $\delta\omega\alpha\text{-}d(A \cup B) \subseteq \delta\omega\alpha\text{-}d(A) \cup \delta\omega\alpha\text{-}d(B)$. we get, $\delta\omega\alpha\text{-}d(A \cup B) = \delta\omega\alpha\text{-}d(A) \cup \delta\omega\alpha\text{-}d(B)$.

(iv) Since $A \cap B \subseteq A$ and $A \cap B \subseteq B$, then from property (ii) we have $\delta\omega\alpha\text{-}d(A \cap B) \subseteq \delta\omega\alpha\text{-}d(A)$ and $\delta\omega\alpha\text{-}d(A \cap B) \subseteq \delta\omega\alpha\text{-}d(B)$. Consequently, $\delta\omega\alpha\text{-}d(A \cap B) \subseteq \delta\omega\alpha\text{-}d(A) \cap \delta\omega\alpha\text{-}d(B)$
